ROSEN C A. RUBEN S M. BARASH S C. (ROSE/) R (RUBE/) R (BARA/) E Barash SC; Rosen CA, Ruben SM,

WPI; 2003-147444/14 N-PSDB; ABX73184. New polypeptides and nucleic acids, useful in gene therapy for treating, inhibiting or preventing e.g. neural, immune system, muscular, respiratory, reproductive, gastrointestinal, pulmonary, cardiovascular or renal disorders.

Claim 11; SEQ ID NO 809; 402pp; English.

The invention relates to human novel polypeptides and their associated polynuclectides. The polypeptides and polynuclectides are useful in gene therapy for treating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g.

```
nasal vestibulitis, nasal polyps and sinusitis), reproductive disorders, quastrointestinal disorders, pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatory diseases (e.g. septic shock, bursitis and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABUS4914-ABUS5699 and ABUS5748 represent human novel polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     scnmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, and autoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from NIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

Claim 27; Page; 190pp; English.

```
The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conclusive may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from MIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                             The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A purintelectide of the invention may have a use in gene therappy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine utoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp confections caused by virus, bacteria, fungi or parasite. The dithp confections and also be used in genetic mapping, in identifying individuals committe biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from NIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

[a] an oligo-dr primer and an oligonucleotide comprises one of the 5602
complementary strand of a polymucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprises a sequence complementary to the
complementary strand of a polymucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polymucleotide comprises at least 15 nucleotides and the combination of
complementary strand of a polymucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence, where the
coligonucleotide comprises at least 15 nucleotides and the combination of
coligonucleotide which comprises a 15 nucleotides and the combination of
coligonucleotide whill-length cDNAs. The primers are also useful for the
capacitication and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
colligonucleotides, and sequences; AAB13628 and
AAH13633 to AAH13633 to AAH13632 represent human anino acid sequences; and AAH13632 represent
coligonucleotides.

complementary strand of a polymucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the comprises an oligonucleotide comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polymucleotide comprises a 1'-end sequence complementary to a polymucleotide comprises at 1'-end sequence, where the comprises at least 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence; where the comprises at least 15 nucleotides and the combination of specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polymucleotides, particularly full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH13632 represent human anino acid sequences; and AAH13629 to AAH13632 represent complementation of the com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a FHAR1 polypeptide, which is a member of the RING finger protein family. FHAR1 is useful in the treatment of cancer, and as a vaccine for inducing an immunological response in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 WIFGRNPACDYHLGNISRLSNKHFQIL--XXXXXXLLNDISINGTWLNGQKVEKNSNQLL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New FHAR1 polypeptide, a member of the RING finger protein family for diagnosing and treating cancer, and for use in anti-cancer vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Amino acid sequence of a human ring finger protein designated FHAR1.

                                                                                                                                   The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTS). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. parkinson's disease. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28

The protein is required for regulation of the transition of cells from prophase to metaphase during mitosis. It has ubiquitin-protein ligase activity. The Chfr checkpoint was evident in primary human cells, but was
mammal. FHAR1 polynucleotides may also be used as a diagnostic reagent through detection of mutations in the associated gene, and for chromosome localization studies, and tissue expression studies. FHAR1 antibodies are useful to isolate and to identify clones expressing the polypeptides, or to purify the polypeptides by affinity chromatography and to treat cancer

c inactivated in 4 of 8 human cancer cell lines. In UZOS cells, a mutation was identified that caused a Val to Met amino acid substitution in the highly conserved C-terminal Cys-rich region of the Chfr protein. In the absence of the Chfr checkpoint, cells subjected to mitotic stress condensed their chromosomes despite failing to separate their chromosomes. Chfr may monitor centrosome separation. Inactivation of the chromosomes. Chfr may monitor centrosome separation. Inactivation of the chromosomes. Chfr may monitor centrosome separation. Inactivation of the chromosomes. Chfr may monitor centrosome separation. Inactivation of the increased sensitivity of cancer cells to antimitotic drugs. Polypeptides increased sensitivity of cancer cells to antimitotic drugs. Polypeptides comprising the present sequence, or sequences comprising at least amino acids 31-103, 303-346 and/or 476-641 of this sequence, are claimed. Claimed methods of determining the tumourigenic potential of a cell comprise examining the cell for the presence of Chfr expression or for the presence of Chfr expression indicating prediaposition to tumourigenesis upon exposure to mitotic stress). A diagnostic kit for detecting the cumourigenic potential of cell cells comprises may comprise a ligand that binds to Chfr, such as an antibody or its fragment. Inhibitors of Chfr are identified by monitoring their effect on Chfr expression, and are used to retard the growth of cancer cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and adentifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium, and acterium acterium acterium, particularly in the present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                 be used to detect inhibitors of cell cycle regulatory factors which can be applied in the development of drugs for treating cancers and proliferative diseases. Cds1 is strongly expressed in the testis as well as other tissues. Cds1 can efficiently phosphorylate cdc25 and histone H1
                                                                                                                                                                                                                             1 WTFGRNPACDY------HLGNISRLSNKHFQIL----XXXXXXLLNDISTNGTWLNG 47

                                    immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TBRaio. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ----RLSNKHFQILXXXXXXLLNDI-STNGTWLNGQKVEKNS 54

The present sequence represents a M.tuberculosis antigen, TDRa10. The immunogenic protein, and fusion proteins containing one or more of the proteins pus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or

This polypeptide comprises Mycobacterium tuberculosis soluble antigen This polypeptide comprises Mycobacterium tuberculosis strain H37Rs expression library with rabbit anti-sera raised against M. tuberculosis supernatant. No significant homology was found between TDRa1 and Genebank database sequences. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAM64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M-tuberculosis antigen, or an immunogenic portion of an M-tuberculosis antigen, as well as DNA sequences encoding such transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the above detecting M. tuberculosis of infection in a patient using the above diagnosis of tuberculosis.                                                                                                                                                                                                                                                                                                                                             This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                        New polypeptide comprising antigenic portions of M. tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mycobacterium tuberculosis; M. tuberculosis; antigen; immunogen; immunotherapy; diagnosis; immunisation; vaccine; infection;

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments drow M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis
                                                                                                                                                                                                                                                                                                                                                                                                                Amino acid sequence of antigen CFP17.

                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                  셤
                                                                                The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. DNa encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. ```
The invention describes a substantially pure immunogenic polypeptide fragment (I) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (1) fusion polypeptide comprising at least one polypeptide fragment (I) and at least one fusion partner; (2) a fusion polypeptide fragment comprising a T-cell epitope from M. tuberculosis protein ESAT-6, or MPTS9 and a second different amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            54

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic fragment of Mycobacterium tuberculosis

are useful as pharmaccuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or bovis. The polypeptides are also useful for diagnosing ongoing or previous sensitization in an animal with bacteria belonging to the tuberculosis complex. The invention also describes the use of CFP7A or response in a mammal; use of CFP7B, CFP19 or MPT59-ESAT6 or a T-cell epitope of for the induction of a strong immune response in a mammal; use of CFP7B, CFP19 or MPT59-ESAT6 or a T-cell epitope of for diagnosis of B in a mammal by performing a DTH type skin test; use of CFP27, CFP30A, RDI-ORF2, RDI-ORF5, MPT59-ESAT6, ESAT6-MPT59, CFP10A, CFP19, CFP27, CFP30B, CFP27, CFP30B, CFP19, CFP27, CFP30B, CFP19, CFP27, CFP30B, CFP19, CFP27, CFP25A, CFP30B, CFP7B or a T-cell epitope of for the preparation of a nimmunological composition; and for the preparation of a subunit vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of the Mycobacterium tuberculosis (Mtb) strain H37Rv gene Rv1827 product, designated CP17. This is one of 31 immunodominant secreted or cytosolic Mtb proteins of strain H37Rv (see AAM50729-59) discovered through the use of 2-dimensional liquid phase electrophoresis coupled with an in vitro interferon-gamma assay and liquid chromatography-mass spectrometry. The immunogens stimulate a strong interferon-gamma response from T cells of M. tuberculosis infected mice. The invention provides vaccine compositions for boosting immunity to mycobacteria when administered in mid-life to a subject who has been vaccinated neonatally or in early childhood with BCG and in whom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                80 GRHPDSDIFLDDVIVSRRHAEFRLENNBFNVV-----DVGSLNGIYVNREPVD--- 127

The present invention describes a method for detecting a cancer cell in a subject, which comprises determining the level of nucleic acid that is subject, which comprises determining the level of nucleic acid or map bosition 8q2.3 of the human genome or its expression product in a sample of the subject, where an elevated level of the concert in a subject comprising a cancer in the subject. Also described: (1) a method for diagnosing a cancer or predicting recurrence of a cancer in a subject comprising a cancer or predicting recurrence of a cancer in a subject complex; (2) the isolated or protein encoded by a nucleic acid as described above; (2) the isolated or complex; (3) a kit for detecting cancer cell; (3) an isolated or recombinant protein complex; (4) an antibody that binds to the protein complex; (5) a kit for detecting cancer cell; (3) an isolated or complex; (5) a kit for detecting or producin parting the protein complex; (5) a kit for detecting or producin danting the protein associated with DNA repair or damage, a nuclear targeting protein, and a second polypeptides selected from a protein having tumour suppressor activity, a protein having cell cycle modulatory activity, a protein associated with DNA repair or damage, a nuclear targeting protein, and a concound polypeptide is sufficient to bind to the EDD polypeptide or the EDD polypeptide or the EDD polypeptide or determining a modulator of the activity, formation or stability of an isolated or recombinant protein complex; (5) a method for determining a modulator of the activity, formation; (10) a method for treating a condition associated with celevated expression of EDD protein in a cell; (11) an antisense nucleic acid, ribozyme, PNA, interfering RNA or siRNA, inderfering RNA or siRNA, and cribozyme, PNA, interfering RNA or siRNA, independent or can be used in gene therapy. The methods and modulator are useful for treating a condition associated with EDD over expression such single acancer or can be used in gene therapy.

ë,
e.g. squamous cell carcinoma, hepatocellular carcinoma, ovarian cancer, breast cancer, melanoma, head and neck cancer, adenocarcinoma, squamous lung cancer, gastrointestinal cancer (e.g. gastric, colon, or pancreatic cancer), renal cell cancer, bladder cancer, prostate cancer, non-squamous carcinoma, glioblastoma and medullablastoma. The components and composition are useful for reducing the expression of EDD in a cell to inhibit cellular proliferation. The present sequence represents human chk2 transcript variant 2 protein, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a number of peptides which disrupt the G2 cell cycle checkpoint when administered to a cell. They act by inhibiting Chk2 (the sequence of which is shown here) and Chk1 kinases, and may be derived from Cdc25C. The peptides are useful in the treatment of cell proliferation diseases, such as cancer, as the inhibition of the Chks allows DNA damage and induces apoptosis
                                                                                                                                                                                                                                                                        47

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a novel human checkpoint kinase, termed hCDS1, that acts in coordination with Cdc25 in the DNA damage checkpoint. The sequence is predicted from a CDNA (see AAXS8793) isolated from a SK-N-MC neuroblastoma cDNA library. The predicted protein is 28% identical to the cdc1 protein of S. pombe. A 2.2 kb transcript is expressed in testis and in 8 human cancer samples examined. hCDS1, its inhibitors and activators, are useful for treating cancer or proliferative disease (claimed). Inhibitors and activators of the kinase activity can also be used in anti-cancer therapy, particularly by increasing susceptibility of cancer cells to chemotherapy and/or radiotherapy (claimed). hCDS1 is useful for modifying DNA damage checkpoint activity of a cancer cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human kinase used for treatment of cancer and proliferative diseases.

The present sequence represents hCDS1, a novel human cell cycle checkpoint kinase that acts in coordination with Cdc25 at the DNA damage checkpoint, rather than the replication checkpoint as found in yeast. The hCDS1 sequence was predicted from hCDS1 cDNA (see AAX25464) that was chost and a human SK-N-MC neuroblastoma cDNA library. It shows 28% cotained from a human SK-N-MC neuroblastoma cDNA library. It shows 28% cotained from a human SK-N-MC neuroblastoma cDNA library. It shows 28% cotained from a human SK-N-MC neuroblastoma cDNA library. It shows 28% cotained from a human SK-N-M neuroblastoma of N-S and 27% identify to the DWN kinase of S. cerevisiae. Northern blot analysis cidentified a single transcript of about 2.2 kb expressed in testis and in 8 human cancer samples examined. The characterisation of hCDS1 and the classifier of paramaceuticals and theraspeutic methods for acting as an adjunct to chemotherapy of cancer. Thus, pharmaceutical formulations cantibodies against the protein, or other therapeutics identified in caseasys of the invention, can be administered in conjunction with any suitable chemotherapy agent to act as an adjunct to the main action of the chemotherapy agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     47

                                                                 The present invention provides the protein and coding sequences of a human Chkz phosphoenzyme inhibitor. The sequences can be used in the chemotherapy of cancers. The present sequence is a protein described in the exemplification of the invention
                                                                                                                                                                                           1 WIFGRNPACDY-----HLGNISRLSNKHFQIL-----XXXXXXLLNDISTNGTWLNG
          encoding a protein for inhibiting human Chk2 phosphoenzyme

```
The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human checkpoint kinase 2 (CHK2). The antisense compound specifically hybridies with and inhibits the expression of human CHK2. The antisense compounds are useful as research reagents and diagnostics, in distinguishing between functions of various members of a biological pathway, and in the treatment of a disease or disorder, which can be treated by modulating the expression of CHK2. This sequence
New antisense oligonucleotides targeted to a nucleic acid encoding checkpoint kinase 2 (CHK2), useful for treating a disease or condition associated with CHK2, or in distinguishing functions of members of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 543 AA;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 17, Application US/08870693

Patent No. 5866338

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Hartwell, Leland H.

APPLICANT: Plon, Sharon B.

APPLICANT: Plon, Sharon B.

TITLE OF INVENTION: Cell Cycle Checkpoint Genes

NUMBER OF SEQUENCES: 19

CORRESPONDENCE ADDRESS:

ADDRESSEE: Christensen O'Connor Johnson Kindness PLLC

STREET: 1420 Fifth Ave., Suite 2800
                                             COMPUTER FRADABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: TBM PC compatible
OPERATION SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/198,446B
FILING DATE: 18-FEB-1994
CLASSIFICATION: 536
ATTONEY/AGENT INFORMATION:
NAME: Sheiness, Diama K.
REGISTRATION NUMBER: 35,356
REFERENCE/DOCKET NUMBER: 35,356
REPRENCE/DOCKET NUMBER: 206-224-0779

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      US-09-902-540-16334

i Sequence 16334, Application US/09902540

i Patent No. 6833447

i GENERAL INFORMATION:

APPLICANT: Goldman, Barry S.

APPLICANT: Goldman, Barry S.

APPLICANT: Hinkle, Gregory J.

APPLICANT: Wiegand, Roger C.

TITLE OF INVENTION: Myxococcus xanthus Genome Sequences and Uses Thereof C.

TITLE OF INVENTION: Wyxococcus xanthus Genome Sequences and Uses Thereof C.

TILLE OF INVENTION: Wyxococcus xanthus Genome Sequences and Uses Thereof CURRENT FILING DATE: 2001-07-10

PRIOR APPLICATION NUMBER: 60/217,883

PRIOR PILING DATE: 2000-07-10

NUMBER OF SEQ ID NOS: 16825

SEQ ID NO 16334
                                                                                                                                Sequence 13360, Application US/09902540
; Sequence 13360, Application US/09902540
; Patent No. 683347
; GENERAL INFORMATION:
; APPLICANT: Goldman, Barry S.

Sequence 43, Application US/09300008B
; Sequence 43, Application US/09300008B
; Patent No. 645854
; GENERAL INFORMATION:
; APPLICANT: Concannon et al.
; TITLE OF INVENTION: A GENE ASSOCIATED WITH NIJMEGEN BREAKAGE
; TITLE OF INVENTION: SYNDROME, ITS GENE PRODUCT AND METHODS FOR THEIR USE
; TITLE OF INVENTION: BYSDROME, ITS GENE PRODUCT AND METHODS FOR THEIR USE
; CURRENT APPLICATION NUMBER: US/09/300,008B
; CURRENT FILING DATE: 1999-04-27
; PRIOR APPLICATION NUMBER: US 60/083,269
; RATOR FILING DATE: 1998-04-27
; NUMBER OF SEQ ID NOS: 64
; SOFTWARE: FastSEQ for Windows Version 3.0
; LENGTH. AND 43

j Patent No. 6812339

j GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYNORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

TURERY APPLICATION NUMBER: US/09/949,016

CURRERY FILING DATE: 2000-04-14

PRIOR PLILING DATE: 2000-10-20

PRIOR APPLICATION NUMBER: 60/231,768

PRIOR PLILING DATE: 2000-10-03

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

protein kinase RAD53 (EC 2.7.1.-) - yeast (Saccharomyces cerevisiae)
NyAlternate names: protein P2588; protein YPL153c; SPK1 protein
C;Species: Saccharomyces cerevisiae
C;Daccession: A33616; S651645

A;Molecule type: DNA A;Residues: 1-821 <STE> A;Cross-references: UNIPROT:P22216; GB:M55623; NID:g172656; PIDN:AAA35070.1; PID:g172657 A; Experimental source: strain S288C

Rizheng, P.; Fay, D.S.; Burton, J.; Xiao, H.; Pinkham, J.L.; Stern, D.F.
Mol. Cell. Biol. 13, 5829-5842, 1993
A,Title: SPK1 is an essential S-phage-specific gene of Saccharomyces cerevisiae that enchance number: A54697; MUID:93361015; PMID:8355715

A; Contents: annotation R; Purnelle, B.; Coster, F.; Goffeau, A. submitted to the Protein Sequence Database, May 1996 **Reference number: S65154

A;Accession: S65164
A;Molecule type: DNA
A;Molecule type: DNA
A;Molecule type: DNA
A;Molecule type: DNA
A;Molecule type: DNA
A;Molecule type: 1 PNA
A;Cross-references: EMBL:273509; NID:g1370325; PIDN:CAA97858.1; PID:g1370326; GSPDB:GN001
A;Experimental source: strain S288C (AB972)
B;Experimental source: strain S288C (AB972)
B;Purnelle, B.; Comblez, S.; Coster, F.; Naveau, F.; Goffeau, A.
B;Purnelle, B.; Comblez, S.; Coster, March 1996
A;Description: The sequence of 55 kb on the left arm of yeast chromosome XVI identifies ogue to the human phosphotyrosyl phosphatase activator PTPA and a homologue to the plant A;Reference number: S69428

A;Accession: S69446

A; Molecule type: DNA A; Residues: 1-821 < PUW>

A, Cross-references: EMBL: X96770; NID: 91403537; PIDN: CAA65568.1; PID: 91403556

A)Gene: SGD:RAD53; SPK1; MEC2; SAD1; MIPS:YPL153c A,Cross-references: SGD:S0006074; MIPS:YPL153c A,Map position: 16L

A) Description: serine/threonine-specific protein kinase
A;Note: contains low activity as tyrosine-specific protein kinase
A;Note: contains low activity as tyrosine-specific protein kinase
A;Note: contains low activity specific protein kinase brockers
C;Superfamily: protein kinase control; nucleus; phosphotransferase; serine/threonine-speci
F;68-133/Domain: kinase interaction domain homology «KIH»
F;196-466/Domain: protein kinase homology «KIN»
F;204-213/Region: protein kinase APP-binding motif
F;207/Active site: Lys #status predicted
